The presence of vancomycin (V) in aminoglycoside group of antibiotics is associated with the risk of development of resistance. For this reason, use of lipidic nanocarriers that are able to incorporate and control antibiotic release is highly desirable. Our study shows that incorporation of vancomycin (V) into liposome (L) improves the antifungal activity against Candida species and provides a strategy to decrease the risk of development of resistance. An antifungal activity assay was performed using 96-well microplates. After addition of 10  $\mu$ L of L to 190  $\mu$ L of Sabouraud broth containing C. albicans, the turbidity of the growth medium decreased by more than 75 af5dca3d97
