Lightroom uses a tagging system, like most other products in the Creative Suite. Tags allow for organization of your images, which you can then search for. There are different types of Lightroom Tags: Name Tags, Sub-Tags, Categories, and Organizers. The latter is what I am referring to as a vital feature to this review article. Normally, when you import photographs, Lightroom imports them into an Organizer. It creates a "temporary" folder that may be used to temporarily hold the images as they are being reviewed. Once the editing is complete and the images are ready for viewing, Lightroom then imports them into a "final" organizer. Organizer presets are meant to make you work faster and smaller. They make sense for some photographers, but, of course, each photographer works differently. So, Lightroom 5 checks to see what kind of Organizers format images, whether they are Creator, Linen, Black and White, Color, or Panorama. If an Organizer is not available, Lightroom does not prompt you for one, but, in fact, it keeps working to make a selection for Photos or a folder. It reminds me of Apple's operating system, where the software will always make a selection for that which is preferred, if it really isn't available. After you import the photos into the selected kit, you can then open a folder in the "Recently Added" group to get a preview of the newly imported images. So, basically, you might ask "what was selected originally?" and get the answer through the Organizer design presets. You can then see what was selected along with its properties. What I have found to be extraordinary in this release is that you can now select which image is the initial one as it is imported. In previous versions, Lightroom did not care about which image is the initial one as it was imported, so you might get two duplicate images of the same image. You can also, while working on an Organizer, select the image that you want to work on next. If you don't have the right image selected, Lightroom will prompt you to select the next, and so on.

Photoshop depends on Camera, and when a photo is shot using a DSLR, the camera must be perfectly aligned with the subject. Most of the users have a simple camera and this is a common problem when they are trying to make the image more professional. The users know that the camera needs to be aligned and the subject needs to be set at a specific distance, but are not able to perform the task easily.
